# pyQuil & QUIL: Low-level quantum programming

Bloch sphere | Quantum gates | Quantum circuits | Notation

# A two-dimensional quantum bit revisited

**Bloch sphere** | Quantum gates | Quantum circuits | Notation

We can write a two-dimensional **qubit** as the vector:

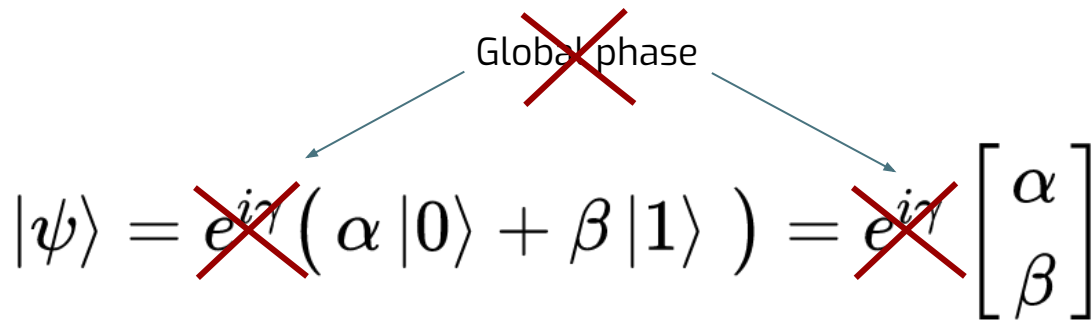

$$|\psi\rangle = e^{i\gamma} \left( \alpha |0\rangle + \beta |1\rangle \right) = e^{i\gamma} \begin{bmatrix} \alpha \\ \beta \end{bmatrix}$$

The diagram illustrates the components of the qubit state vector  $|\psi\rangle$ . The equation is written as  $|\psi\rangle = e^{i\gamma} (\alpha |0\rangle + \beta |1\rangle) = e^{i\gamma} \begin{bmatrix} \alpha \\ \beta \end{bmatrix}$ . Annotations with arrows point to specific parts: 'Global phase' points to  $e^{i\gamma}$  in both forms; 'Ground state' points to  $|0\rangle$ ; 'Excited state' points to  $|1\rangle$ ; and 'Amplitudes' points to the column vector  $\begin{bmatrix} \alpha \\ \beta \end{bmatrix}$ .

# A two-dimensional quantum bit revisited

**Bloch sphere** | Quantum gates | Quantum circuits | Notation

We can **always** drop the **global phase** since it's immeasurable:

The diagram illustrates the removal of a global phase from a quantum state vector. At the top, the text "Global phase" is crossed out with a large red 'X'. Two blue arrows point from this text to the exponential phase factors in the equation below. The equation is  $|\psi\rangle = \cancel{e^{i\gamma}} (\alpha |0\rangle + \beta |1\rangle) = \cancel{e^{i\gamma}} \begin{bmatrix} \alpha \\ \beta \end{bmatrix}$ . The  $e^{i\gamma}$  terms are also crossed out with red 'X's.

$$|\psi\rangle = \cancel{e^{i\gamma}} (\alpha |0\rangle + \beta |1\rangle) = \cancel{e^{i\gamma}} \begin{bmatrix} \alpha \\ \beta \end{bmatrix}$$

$$|e^{i\gamma} \alpha|^2 = e^{i\gamma} \alpha e^{-i\gamma} \alpha^\dagger = e^{i\gamma - i\gamma} \alpha \alpha^\dagger = \alpha \alpha^\dagger$$

# Bloch sphere

**Bloch sphere** | Quantum gates | Quantum circuits | Notation

$$|\psi\rangle = \alpha |0\rangle + \beta |1\rangle$$

$$|\psi\rangle = \cos\left(\frac{\theta}{2}\right) |0\rangle + e^{i\phi} \sin\left(\frac{\theta}{2}\right) |1\rangle$$

where  $0 \leq \theta \leq \pi$  and  $0 \leq \phi < 2\pi$

$$x = \sin(\theta) \cos(\phi)$$

$$y = \sin(\theta) \sin(\phi)$$

$$z = \cos(\theta)$$

# Bloch sphere

**Bloch sphere** | Quantum gates | Quantum circuits | Notation

**Quantum gates** rotate the Bloch vector

The Bloch sphere provides a **visual tool** to understand quantum gate operations.

The Bloch sphere **only applies to single qubit states**. Visualizing multi-qubit states is out of the scope of this tutorial.

# Single-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## Classical NOT Gate

NOT

| Input | Output |
|-------|--------|
| 0     | 1      |
| 1     | 0      |

# Single-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## Quantum X (NOT) Gate

| Input | Output |
|-------|--------|
| 0     | 1      |
| 1     | 0      |

$$|\psi\rangle = \alpha |0\rangle + \beta |1\rangle = \begin{bmatrix} \alpha \\ \beta \end{bmatrix}$$

$$? \times \begin{bmatrix} 1 \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$|0\rangle \qquad |1\rangle$

# Single-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## Quantum X (NOT) Gate

| Input | Output |
|-------|--------|
| 0     | 1      |
| 1     | 0      |

$$|\psi\rangle = \alpha |0\rangle + \beta |1\rangle = \begin{bmatrix} \alpha \\ \beta \end{bmatrix}$$

$$\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \times \begin{bmatrix} 1 \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$|0\rangle \qquad |1\rangle$

# Single-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## X (NOT) Gate

NOT

X

$$X |0\rangle = |1\rangle$$

$$X |1\rangle = |0\rangle$$

$$\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \times \begin{bmatrix} \alpha \\ \beta \end{bmatrix} = \begin{bmatrix} \beta \\ \alpha \end{bmatrix}$$

# Single-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## Pauli Y

$$Y |0\rangle = i |1\rangle$$

$$Y |1\rangle = -i |0\rangle$$

$$\begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix} \times \begin{bmatrix} \alpha \\ \beta \end{bmatrix} = \begin{bmatrix} -i\beta \\ i\alpha \end{bmatrix}$$

# Single-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## Pauli Z

$$Z |0\rangle = |0\rangle$$

$$Z |1\rangle = -|1\rangle$$

$$\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \times \begin{bmatrix} \alpha \\ \beta \end{bmatrix} = \begin{bmatrix} \alpha \\ -\beta \end{bmatrix}$$

# Properties of single-qubit gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

$$|\langle \Psi | \Psi \rangle|^2 = 1$$

The **Bohr rule** states that the inner product **must equal to unity**.

# Properties of single-qubit gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

$$|\Psi'\rangle = U |\Psi\rangle$$

$$|\langle\Psi' | \Psi'\rangle|^2 = 1$$

Quantum gates **must preserve normalization.**

# Properties of single-qubit gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

$$|\Psi'\rangle = U |\Psi\rangle \qquad |\langle\Psi' | \Psi'\rangle|^2 = 1$$

$$|\langle\Psi| U^\dagger U |\Psi\rangle|^2 = 1$$

$$U^\dagger U = \mathbb{I}$$

The only requirement for a quantum gate is **unitarity**.  
**Hence, there are infinitely many quantum gates!**

# Properties of single-qubit gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

**Quantum gates** must be **unitary**:

$$UU^\dagger = U^\dagger U = \mathbb{I}$$

**Example:**

$$S = \begin{bmatrix} 1 & 0 \\ 0 & i \end{bmatrix}$$

$$S^\dagger = \begin{bmatrix} 1 & 0 \\ 0 & -i \end{bmatrix}$$

Hermitian  
conjugate

$$SS^\dagger = \begin{bmatrix} 1 & 0 \\ 0 & i \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & -i \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & -i^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \mathbb{I}$$

# Properties of single-qubit gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

Some quantum gates (e.g. Pauli gates) are **hermitian**:

$$U = U^\dagger$$

**Example:**

$$X = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} = X^\dagger = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

# Elementary single-qubit gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

|          |   |  |
|----------|---|--|
| Hadamard |  | $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$ |
| Pauli-X  |  | $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$                     |
| Pauli-Y  |  | $\begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$                    |
| Pauli-Z  |  | $\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$                    |
| Phase    |  | $\begin{bmatrix} 1 & 0 \\ 0 & i \end{bmatrix}$                     |
| $\pi/8$  |  | $\begin{bmatrix} 1 & 0 \\ 0 & e^{i\pi/4} \end{bmatrix}$            |

`from pyquil.gates import H`

`from pyquil.gates import X`

`from pyquil.gates import Y`

`from pyquil.gates import Z`

`from pyquil.gates import S`

`from pyquil.gates import T` + **many more!**

**A lot of quantum gates** are **already implemented** in pyQuil.

# Multi-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## Controlled-NOT (CNOT) gate

```
from pyquil.gates import CNOT
```

| Target qubit | Control qubit | Output    |
|--------------|---------------|-----------|
| 0            | 0             | 00        |
| <b>0</b>     | <b>1</b>      | <b>11</b> |
| 1            | 0             | 10        |
| <b>1</b>     | <b>1</b>      | <b>01</b> |

Essential for **entangling** two qubits!

# Multi-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## SWAP gate

```
from pyquil.gates import SWAP
```

The SWAP operation allows us to **move qubits on the quantum processor!**

# Multi-qubit quantum gates

Bloch sphere | **Quantum gates** | Quantum circuits | Notation

## Toffoli (CCNOT) gate

Control qubit #1

Control qubit #2

Target qubit

| Target qubit | Control qubit #1 | Control qubit #2 | Output |
|--------------|------------------|------------------|--------|
| 0            | 1                | 0                | 010    |
| 0            | 0                | 1                | 001    |
| 0            | 1                | 1                | 111    |

```
from pyquil.gates import CCNOT
```

# Quantum circuits

Bloch sphere | Quantum gates | **Quantum circuits** | Notation

Initial qubit state ( $|000\rangle$ )

# Quantum circuits

Bloch sphere | Quantum gates | **Quantum circuits** | Notation

Single-qubit gates

# Quantum circuits

Bloch sphere | Quantum gates | **Quantum circuits** | Notation

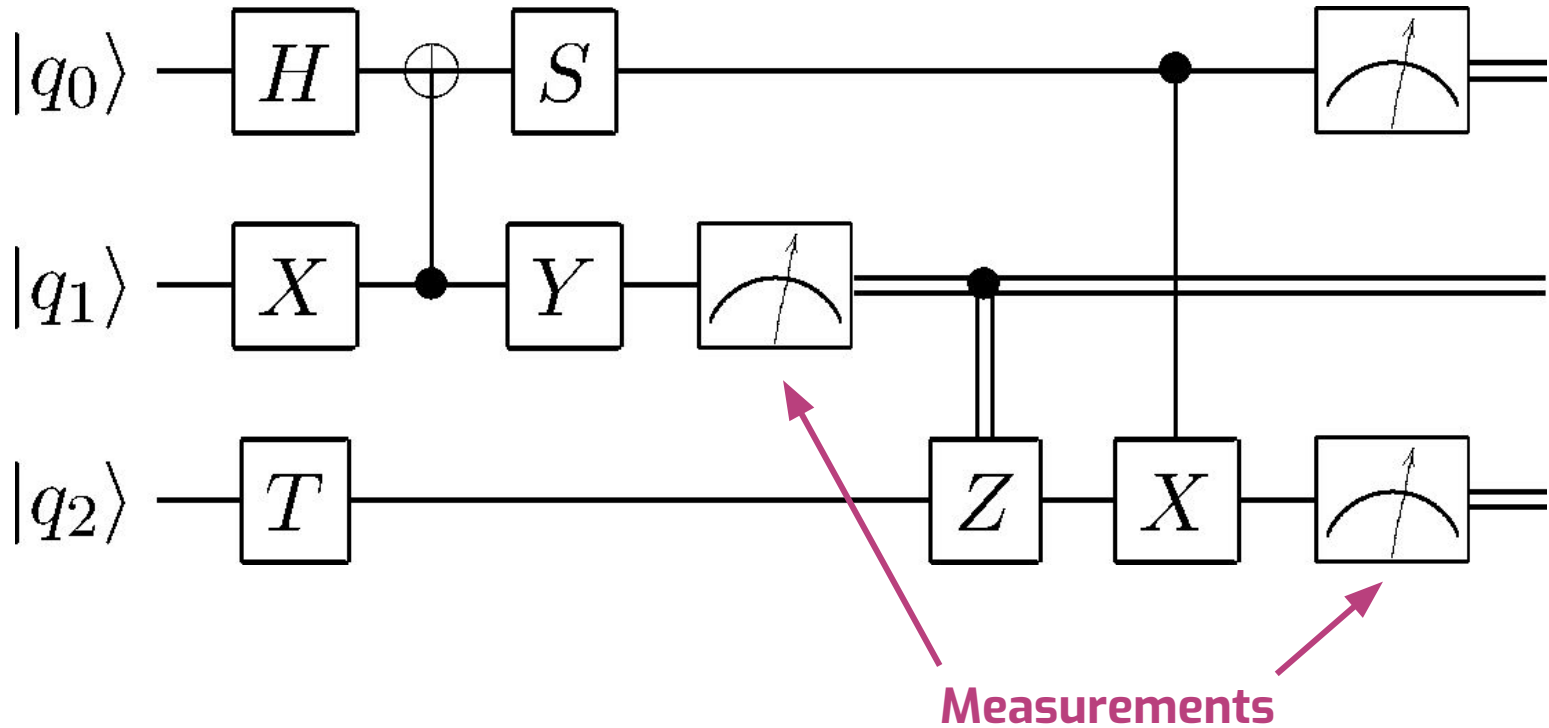

**controlled-NOT (CNOT)**

# Quantum circuits

Bloch sphere | Quantum gates | **Quantum circuits** | Notation

# Quantum circuits

Bloch sphere | Quantum gates | **Quantum circuits** | Notation

**Rigetti's shared memory** makes such operations very easy!

# Notation

Bloch sphere | Quantum gates | Quantum circuits | **Notation**

$$|000\rangle$$

Is the **super lazy** physicist's version of

$$|0\rangle |0\rangle |0\rangle$$

which is the **lazy** physicist's version of

$$|0\rangle \otimes |0\rangle \otimes |0\rangle$$

# Notation

Bloch sphere | Quantum gates | Quantum circuits | **Notation**

This is a **common convention** in quantum computing.  
You will explore the reasoning behind this in the next tutorial.

# Notation

Bloch sphere | Quantum gates | Quantum circuits | **Notation**

$$Z_0 \otimes Z_1 \otimes Z_2$$

is the **lazy** physicist's version of

$$\sigma_0^Z \otimes \sigma_1^Z \otimes \sigma_2^Z$$

# Pen & Paper quantum computing

Bloch sphere | Quantum gates | Quantum circuits | Notation

To finish it up, let's put it all together and walk through a **quantum circuit with pen & paper!**

# Pen & Paper quantum computing

Bloch sphere | Quantum gates | Quantum circuits | Notation

$$|00\rangle \rightarrow (\mathbb{I} \otimes H) |00\rangle$$

In a multi-qubit system don't forget the **tensor product with the identity matrix!**

# Pen & Paper quantum computing

Bloch sphere | Quantum gates | Quantum circuits | Notation

$$|00\rangle \rightarrow (\mathbb{I} \otimes H) |00\rangle \rightarrow \text{CNOT}(0, 1)(\mathbb{I} \otimes H) |00\rangle$$

Pay attention to the **order of operations!**

# Pen & Paper quantum computing

Bloch sphere | Quantum gates | Quantum circuits | Notation

$$\begin{aligned}\text{CNOT}(0, 1)(\mathbb{I} \otimes H) |00\rangle &= \text{CNOT}(0, 1) \left[ \frac{1}{\sqrt{2}} |00\rangle + \frac{1}{\sqrt{2}} |01\rangle \right] \\ &= \frac{1}{\sqrt{2}} |00\rangle + \frac{1}{\sqrt{2}} |11\rangle = |\Phi^+\rangle\end{aligned}$$

This is a maximally entangled state. It's often called the **first Bell state**.

Now, please start  
working through the exercises  
in the Jupyter Notebook for  
**Tutorial 2**
